Subject:

## Please search the following:

1. SEQ ID NO:35

2. oligo search of at least 20 contiguous bases of SEQ ID NO:35. Please search both commercial and issued patents databases. Thanks

                                                                                                                                                                                                                                                 The present sequence is that of an isolated nucleic acid, designated ESP002_C2, of Exophiala spinifera isolate ESP002, which encodes an amino polyol amine oxidase (APAO, see AAV58900), capable of degrading fumonishin, its hydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of ESP002 mycelalal DNA using primers based on APAO of E. spinifera AYCC 74269. The invention provides ARAO polybucleotides (see AAZ58383-87) and polypeptides (see AAY58900-05) of E. spinifera and thinocladdialla atrovitens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Transgenic plants can be regenerated from the transformed plant cells. Also provided are methods for expressing both APAO enzyme in prokaryotic and non-plant enkaryotic producing APAO enzyme in prokaryotic and non-plant enkaryotic systems. Transgenic plants capable of degrading fumonisin or of systems. Transgenic plants capable of degrading fumonisin or of detoxification of gradin genzymes are provided. Methods for cops and in animal feed and rumen microorganisms are also disclosed. APAO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CACATCGGCGTAGGCCCAAACGAAGCGAGGTATGTGACAATAGCTGGACAGATTGGACAA 120

The present sequence is that of an isolated nucleic acid, designated ESP00_2. G. of Exophiala spinifera isolate ESP002, c. designated ESP00_2. G. of Exophiala spinifera isolate ESP002, c. which encodes an amino pollyol amino oxidase (APAO, see AAY58901) capable of degrading fumonisin, its hydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of ESP002 mycelial DNA using primers based on APAO of E. spinifera ATCC 74269. The invention provides APAO polymucleotides (see AAX58383-87) and polypeptides (see AAX58900-05) of E. spinifera and Rhinocladialla atrovirens. The polymucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Transgenic plants can be regenerated from the transformed plant cells. Also provided are methods for expressing both APAO and a fumonisin-esterase in a transgenic plant, and for producing APAO enzyme in prokaryotic and non-plant eukaryotic systems. Transgenic plants capable of degrading fumonisin or of producing the degrading enzymes are provided. Methods for cops and cetoxification of grain, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed. APAO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             540

The present sequence is that of an isolated nucleic acid, designated ESP003_C12, of Exophiala spinifera isolate ESP002, which encodes an amino polyol amine oxidase (APAO, see AAY58902) capable of degrading fumonisin, its hydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of ESP003 mycelial DNA using primers based on AAPO of E. spinifera AAC 74269. The invention provides APAO polynuclectides (see AAX5883-87) and polypeptides (see AAX58900-05) of E. spinifera and Rhinocladiella atrovirens. The polynuclectides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Transgenic plants can be regenerated from the
                                                                                                                                                                                                                                                                                       Amino polyol amine oxidase; fumonisin; mycotoxin; transgenic plant; detoxification; animal feed; silage; selectable marker; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotides, polypeptides useful for detecting and degrading fumonisin or structurally related mycotoxin in processed

                                                                                                                                                                                                                                                                                                                     1;
transformed plant cells. Also provided are methods for express both APAO and a fumonishn-esterase in a transgenic plant, and producing APAO enzyme in prokaryotic and non-plant eukaryotic systems. Transgenic plants capable of degrading fumonish or producing the degrading enzymes are provided. Methods for detoxification of grain, grain processing, sliage, food crops in animal feed and rumen microorganisms are also disclosed. A polynucleotide is also useful as a selectable marker.
                                                                                                                                                                                                                                                                                                                   Indels

The present sequence is that of an isolated nucleic acid, designated RAT011-C2, of Rhinocladiella atrovirens isolate RAT011, which encodes an amino polyol amine oxidase (APAO, see AAY58904) capable of degrading fumonisin, its hydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of RAT011 mycelial DNA using primers based on APAO polynucleotides (see AAC58383-87) and polypeptides (see AAX58900-05) of R. atrovirens and Exophiala spinifera. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     useful for detecting and mycotoxin in processed
                                                                                                                                                           Amino polyol amine oxidase; fumonisin; mycotoxin; transgenic plant; detoxification; animal feed; silage; selectable marker; ds.
                                                                                                                            Rhinocladiella atrovirens amino polyol amine oxidase RAT011-C2 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          fungus infection. Transgenic plants can be regenerated from the transformed plant cells. Also provided are methods for expressing both APAO and a fumonisin-esterase in a transgenic plant, and for producing APAO enzyme in prokaryotic and non-plant eukaryotic systems. Transgenic plants capable of degrading fumonisin or of producing the degrading enzymes are provided. Methods for detoxification of grain, grain processing, sliage, food crops and in animal feed and rumen microorganisms are also disclosed. APAO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotides, polypeptides useful for degrading fumonisin or structurally related mycotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 1928 BP; 450 A; 527 C; 534 G; 417 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                δ
```

```
The present sequence is that of an isolated nucleic acid, casignated RAPO11-C4, of Rhinocladiella atrovirens isolate RAT011, which encodes an amino polyol amine oxidase (APAO, see AAY58905) capable of degrading fumonisin, its hydrolysis product API, and caracted mycotoxins. The DNA was obtained by PCR amplification of RAT011 mycelial DNA using primers based on APAO of E. spinifera ATCC 74269. The invention provides APAO polynucleotides (see CAA258383-87) and polypeptides (see AAY58900-05) of R. atrovirens and Exophiala spinifera. The polynucleotides are used to transformed plant cells normally susceptible to Fusarium or other toxin-producing transformed plant cells. Also provided are methods for expressing both APAO and a fumonish-esterase in a transgenic plant, and for green managenic plant enkaryotic and non-plant enkaryotic and managenic plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 CACATCGGCGTAGGCCCAAACGAAGCGAGGTATGTGACAATAGCTGGACAGATTGGACAA 120

                                                                                       οy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ij
                                                                                                                                                                                                                                                      The present sequence is that of an isolated nucleic acid, designated RAT011-C1, of Rhinocladiella atrovirens isolate RAT011, which encodes an amino polyol amine oxidase (APAO, see AAY5893) capable of degrading fumonisin, its hydrolysis product API, and related mycoctoxins. The DNA was obtained by PCR amplification of RAT011 mycelial DNA using primers based on APAO of E. spinifera ATCC 74269. The invention provides APAO polynucleotides (see AAY58930-05) of R. atrovirens and Exophiala spinifera. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing tungus infection. Transgenic plants can be regenerated from the transformed plant cells. Also provided are methods for expressing both APAO and a fumonish-esterase in a transgenic plant, and for systems. Transgenic plants can hor-plant eukaryotic systems. Transgenic plants capable of degrading fumonish or of producing the degrading enzymes are provided. Methods for cyps and in animal feed and rumen microorganisms are also disclosed. APAO plynucleotide is also useful as a selectable marker.

The present sequence is that of the coding region of full-length amino polyol amine oxidase (APAO) CDNA of Exophiala spinifera 2141.10. APAO is capable of degrading fumonishin, its hydrolysis product API, and related mycotoxins. The invention provides APAO polynucleotides (see AAZ58383-87) and polypeptides (see AAY58900-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Transgenic plants can be reconsisted from the transformed plant cells. Also provided are methods for expressing both APAO and a fumonishin esterase in a transgenic plant, and for producing APAO enzyme in prokaryotic and non-plant eukaryotic systems. Transgenic plants capable of degrading con-plant eukaryotic systems. Transgenic plants capable of degrading (monishin or of producing the degrading enzymes are provided. Methods for detoxification of grain, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed. APAO polynucleotide is also useful as a selectable marker.
                                                                                                                             of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GACGCTTTGGGCGTGACAGACCCAGCCTACGAGAAACAGGTTGCCCAAGCATTCGCCAAT 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  including expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence encodes a full length Exophiala spinifera aminopolyol amine oxidase (APAO). The enzyme has homlology to the flavin containing amine oxidase family, that oxidise primary amine to an aldehyde or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by-product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants own defensive systems. The APAO polynucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other fungi that produce mycotoxins and/or to degrade such mycotoxins
Aminopolyol amine oxidase; APAO; mycotoxin degradation; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (e.g. during ensilaging); for recombinant production of APAO polypeptides, as selection markers for plant transformation; and to isolate related sequences from other organisms. ```
The present sequence is that of a polynucleotide encoding a GST.APAO fusion protein (see AAY58918) composed of glutathione S transferase and Exophiala spinifera amino polyol amino oxidase (APAO). 2 Codons of the APAO coding region have been altered by site-directed mutagenesis in order to change the glycosylation sterem of the fusion protein. These were the replacement of AAT (ASD) by TCC (Ser) at codon 430, and replacement of AAT (ASD) at codon 435. APAO is capable of degrading fumonisin and related mycotoxins. The invention provides APAO polynucleotides can and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other coxin-producing fungus infection. Also provided are methods for expressing APAO in transgenic plants, prokaryotic and non-plant cukaryotic systems. Methods for detexification of grain, grain processing, silage, food crops and in animal feed and rumen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           detecting and in processed

The present sequence encodes a fusion protein of GST and a mutated Exophiala spinifera aminopolyol amine oxidase (APAO). The APAO protein has been mutated to remove potential glycosylation sites at postions 201 and 206. The APAO enzyme has homology to the flavin contraining amine oxidase family, that oxidise primary amine to an aldehyde or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Contrainting on of mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins has paped generates, as a by-product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants own defensive systems. The APAO polyuucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other fungi that produce mycotoxins and/or to degrade such mycotoxins

CC (e.g. during ensilaging); for recombinant production of APAO polypeptides, as selection markers for plant transformation; and to isolate related sequences from other organisms. The APAO polypeptides

CC isolate related sequences from other organisms. The APAO polypeptides

In engineered bacteria and fungi, e.g. rumen microflora.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ
                                                              Ω
                                                                                                                                                                                                   The present sequence is that of polynucleotide k0n0-395_5.4, which encodes a truncated, but still functional, amino polyol amine oxidase (trApko-1, see AAY58907 and AAY58908). The polynucleotide was obtained by 3' and 5' RACE PCR using k0n0-395.5 (see AA258388), a partial APAO. CDNA of Exophiala spinifera. APAO is capable of degrading fumonisin, its hydrolysis product API and related myxocxins. The invention provides APAO polynucleotides (see AA258383-87) and polypeptides (see AA258900-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Also provided are methods for expressing APAO in transgenic plants, prokaryotic and non-plant eukaryotic systems. Methods for edetoxification of grain, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed. APAO

The present sequence encodes an Exophiala spinifera aminopolyol amine oxidase (APAO). The enzyme has homlology to the flavin containing amine oxidase family, that oxidise primary amine to an aldehyde or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by-product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants own defensive systems. The APAO polynucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other fungithat produce mycotoxins and/or to degrade such mycotoxins (e.g. during ensilaging); for recombinant production of APAO polypeptides; as selection markers for plant transformation; and to isolate related account of the programs of the APAO polypeptides are used to account the APAO plants of the APAO plants of the APAO plants are used to account the APAO plants of the APAO

The present sequence is that of a polynucleotide encoding a fusion protein (see AAY58915) composed of the barley alpha-amylase signal peptide, and a bacterial fumorish esterase (BEST1) joined via a peptide linker to K:traPAPO (see AAY5809), a truncated, but functional, amino polyol amine oxidase of Exophiala spinifera. The construct was designed for expression and secretion in plants of a hybrid protein having BEST1 and APAO activity. The invention provides APAO polynucleotides (see AAX58383.87) and polypeptides (see AAY58900-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin producing fungus infection. Also provided are methods for expressing APAO, optionally as a fusion protein with fumosinin esterase, in transgenic plants, chrokaryotic and non-plant eukaryotic systems. Methods for prokaryotic and non-plant eukaryotic systems. Methods for crops and in animal feed and rumen microorganisms are also disclosed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1009 GCTCGGTGTGGAAGCCCACGAGATCAGCATTTTTTTTCTCACCGACTACATCAAGAGTGC 1068

The present sequence encodes a fusion protein of Exophiala spinifera aminopolyol amine oxidase (APAO) and a bacterial fumonisin esterase. The APAO enzyme has homilology to the flavin containing amine oxidase family, that oxidise primary amine to an aldehyde or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by-product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants own defensive systems. The APAO polynoucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other fungi that produce mycotoxins and/or to degrade such mycotoxins (e.g. during ensilaging); for recombinant production of APAO polypeptides; as selection markers for plant transformation; and to isolate related sequences from other clasmins. The APAO polypeptides are used to degrade mycotoxins in plant materials, including expression in engineered bacteria and fungi,
             Aminopolyol amine oxidase; APAO; mycotoxin degradation; antimicrobial;

                                                                                                                                                           The present sequence is that of a polynucleotide encoding a fusion protein (see AAY58914) composed of the barley alpha-amylase signal peptide, and Exophiala spinifera fumonistin esterase (ESP1) joined via a peptide linker to K:trAPAO (see AAY58909), a truncated, but functional, amino polyol amine oxidase of E. spinifera. The construct was designed for expression and secretion in plants of a hybrid protein having ESP1 and APAO activity. The invention provides APAO polynucleotides (see AAX58383-87) and polypeptides (see AAX58900-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Also provided are methods for expressing APAO, optionally as a custom protein with fumosinin esterase, in transgenic plants, prokaryotic and non-plant eukaryotic systems. Methods for detoxification of grain, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2015
